Software as a Services

Our Cloud team combines the skills of our hardware and software engineers who can develop and deliver your business applications on your mobile, tablet and PC.

Focus on SharePoint

As businesses develop in scale and complexity their need to manage information and share it with key partners grows exponentially. Business units can span geographic locations and information is constantly being produced and consumed. When information silos are opened up, rapid and intuitive information discovery can assist better decision-making and increased productivity.

SharePoint is a powerful tool which we have customised for business uses as diverse as an internal information portal for an insurance broker, through to a project collaboration tool for Oil and Gas engineering teams across the globe.

Creating applications to support your business

Our Software Department allows us to provide clients with a bespoke solution to the particular frustrations that businesses invariably experience using off-the-shelf software. This can be aimed at driving efficiency, increasing revenues or helping to reinforce or determine the culture of the business.

Be it a new or updated website, a new application to help run your business or a mobile solution to help you stay in touch whilst away from the office, we pride ourselves on establishing a close working relationship to understand our clients' needs. We therefore strive to provide software that is easy and intuitive to use, does what it is needed to do and offers a speedy return on the investment made.

Once the solution has been delivered, our aim is to continue working with you to ensure that the solution remains fit-for-purpose. As the demands of your business change, we are there to support the software and provide agreed updates and enhancements to allow your software to adapt accordingly.
